

# Hybrid application environments for every need

When it comes to digitizing processes, a hybrid approach may be the best way to get started using the equipment and systems you already have in place. Upland Document Workflow products bridge the gap between on-premise functionality and cloud capabilities when it comes to document capture, routing, delivery, and beyond.

## Maintain your local presence.

Local presence is essential when connecting to devices and other applications tied to an organization's network.

- Save on immediate upgrade costs by taking advantage of your organization's existing infrastructure and systems
- Enhance data security by storing highly sensitive data in on-premise data centers
- Lower IT spending and operational costs by splitting capabilities between on-premise and cloud to address needs during peak usage times

## Bridge the on-premise to cloud gap.

As more organizations incorporate cloud technology alongside local connections, hybrid implementations can bridge that gap to provide users with the best of both worlds.

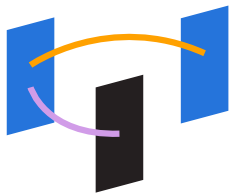

- Make data and applications accessible for remote workers
- Effortlessly increase scalability of operations
- Improve disaster recovery and ensure business continuity
- Ensure compliance with a long list of data security protocols, including HIPAA, PCI DSS, and more

# See why hybrid technology is driving the future of work

## Hybrid

As they begin their digital transformation journey, many organizations turn to hybrid technology as it provides the same benefits of an on-premise environment with the additional capabilities offered with cloud applications. By combining one or more Upland Document Workflow products, users can offload the burden of maintaining hardware and benefit from other features that are synonymous with cloud while taking full advantage of everything Upland and local presence has to offer.

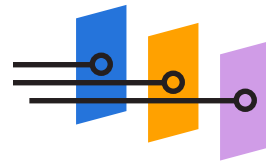

- Can easily be added to existing implementations
- Ultimate set up for the greatest flexibility
- Redundancy, failover, and load balancing
- Maintain local presence for connections that require it

## Cloud

Upland cloud applications allow for anywhere use—whether through a responsive web UI, mobile application, or other methods such as email integration. Even more, customers don't have to worry about hardware maintenance and upkeep. Cloud cuts out the tedious work of upgrading, troubleshooting, and worrying about the time impact required for those tasks while ensuring consistent uptime.

- Perfect for small or medium-sized businesses that want lower responsibility
- Redundant and highly available
- Powerful APIs
- Responsive web interfaces
- Cloud capabilities available with Upland Intelligent Capture, FileBound, InterFAX, and AccuRoute CloudFAX

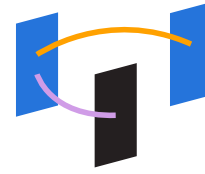

## On-Premise

Upland's on-premise technology provides local, secure, and reliable infrastructure designed with infinite scaling capabilities. On-premise allows for deep integration into a business's existing infrastructure from the front end with integrated MFP Panel Buttons to the end destination of a DMS, such as iManage or NetDocuments.

- Ideal for large organizations with high volumes
- Can leverage traditional fax hardware as well as FoIP
- Redundancy, failover, and load balancing
- Required for some user experiences, including the device client and some line of business (LOB) applications
- On-premise functionality available with Upland Intelligent Capture, FileBound, and AccuRoute

## Complementary products

Mix and match any of our Document Workflow products for a secure, automated end-to-end solution.

-  **Intelligent Capture**
-  **InterFAX**
-  **FileBound**
-  **AccuRoute**

**Upland Document Workflow's expert team will help you define the right strategic approach for your digital transformation needs and ensure our technology aligns with your goals, resources, and processes.**
